

SECTORS

FRICTION

Friction material is employed in brake pads and clutches. These materials are highly abrasive and are therefore very difficult to machine.

POMDI designs and manufactures diamond tools for:

1. Rollers used to grind plates to measure.
2. Slotting discs.
3. Bevelling tools.
4. Sharpening wheels.

These are available in various configurations — as complete tools, as segments and as replacement parts.

One of our biggest advantages is our ability to redress these tools to each client's individual requirements.
