GFRP PIPES

GFRP (Glass-Fibre-Reinforced Polyester) pipes are characterised by their low weight and high corrosion resistance. GFRP pipes are used for a wide range of supply, irrigation, sewerage and industry applications.

As these materials require machining prior to use, POMDI manufactures the following electrolytically bonded tools:

1. Cutting discs (with or without bevel).
2. Radius milling tools for pipe ends to facilitate coupling.
3. Facing and bevelling milling tools.
