

SECTORS

STEEL

Steelworks break up steel scrap then melt it down into a semi-product known as a billet. These billets are then rolled in rolling mills to produce bars, corrugated coils or rods of varying cross sections and diameters.

We manufacture the following tools for this sector:

1. Metal-bonded and/or electrolytically bonded 14FF1 and 9FF1 grinding wheels used to dress roller cassette channels in rolling mills.
2. 1A1 grinding wheels used to dress the roller cassettes' flat surfaces.
3. PCD or PCBN inserts used to machine corrugation moulds.
